

When it comes to IT, risk zero does not exist. Therefore CEO's should nowadays make their companies resilient. In other words, capable of anticipating operational risks, reacting to any problems in no time and evolving together with the market.

Incidents

Every day, incidents affecting major players are reported in the media. In fact, thousands of service interruptions happen every day: human error, technological bugs, malicious attacks, natural disasters, etc. Several days may be necessary to get back to normal operations, unless automatic processes have been implemented to trigger the switch to a backup system. In this case, the user is not even aware a problem happened. It is still necessary to set up preventive measures to enable the resilience process to run. In this particular field, **ebrc** has been building its' expert status in the Greater Region based on its experience, its world-class Data Centres and its Managed Services recognised and awarded by numerous national and international distinctions.

A pragmatic approach

When implementing a preventive & risk management strategy with a client, the key question is whether the planned system meets the company's business requirements. The analysis must consider issues such as regulations, the company's resources and also include a strong dose of realism to anticipate any difficulties which may hinder the effective implementation of the system.

It is by no means a coincidence that the "R" in **ebrc** stands for "Resilience": as a leading market provider in hosting,

data protection and IT Outsourcing, **ebrc** allows its clients to concentrate serenely and efficiently on their core business.

In the heart of Europe

For its CEO, Yves Reding, and its staff, **ebrc**'s objective is clear: becoming a benchmark player throughout Europe with now offices in Paris, Brussels & Frankfurt.

Recently ISO 27001 and Tier IV-Design certified, **ebrc** holds all the keys to meet the highest requirements of its international clients willing to outsource the management of their mission-critical platforms in Luxembourg, at the very heart of Europe.
