

Alexandre Duwaerts,
Client Development Director d'ebrc

“Is our Information risk strategy aligned with our business requirements?”

Information security is the most valuable asset for a business, in any industry. Due to regulatory constraints, multiplied individual access to enterprise data, multiple and complex technologies, sensitive data is at risk, more than ever.

As organisations embark on an Information security policy programme, their major issue, as well as ebrc's itself, is not about “do we need an Information security strategy?” but rather “is our Information risk strategy aligned with our business requirements?”

As a matter of fact, security activities are too often dispersed, diluted and fragmented within the organisation: through ebrc's Resilience top-down and bottom-up approach, security scenarios converge into a comprehensive programme rendering related efforts efficient across all layers of the organisation.

At ebrc, we focus on formal and realistic Information risk mitigation plans and ensure organisations that security controls are in place and operated as intended by the business, implying rational security investments.

Security consists in far more than deploying the latest technology: processes, control as well as the ability to adjust to a rapidly changing security landscape or economic environment are just as important. The

significance accorded to business continuity and information security management is a real-time issue that ebrc continuously applies throughout its organisation to anticipate its own risks, and face its clients'.

ebrc is the first managed hosting provider in Luxembourg to achieve the ISO 27001 certification. This international “Information Security Management” standard comprehensively defines the requirements for establishing, implementing and documenting effective information Security Management System.

With the guarantee of a unique “one-stop-shop” for resilience services, ebrc offers coherent solutions that create value for its clients by understanding business requirements, risk and financial constraints. This “Resilience as a Service”

strategy allows ebrc's clients to implement and manage a wide organisational, functional and technical risk mitigation programme including:

- Risk and Resilience Advisory Services;
- IT Outsourcing services (based on the ITIL framework);
- Data centres services (4 highly secured interconnected hosting sites up to Tier IV classified);
- Open Carrier hotel services (unlimited connectivity);
- Data protection services (from storage to restoration including backup services);
- Business Continuity services;
- Recovery platform services.
